Homo sapiens AID gene for activation-induced cytidine deaminase, complete cds.
AB040430
AB040430.1 GI:9988407
AID; activation-induced cytidine deaminase.
Homo sapiens DNA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SEQUENCING READ COVERAGE:Sequencing is completed to a minimum standard of double strand coverage with a minimum of 2 clones and 2 reads with no ambiguittes or 2 chemistries with a minimum of 2 clones and 3 reads with no ambiguities. If the sequence quality for a region does not meet this standard, it will be indicated in the annotation as Low Coverage.
                                                                                                                                                                                                                                                                                                                                                                                                                                                CLONE LENGTH: This sequence does not necessarily represent the entire insert of this clone. Overlapping regions of clones are only sequenced and submitted once, so the sequence for the remainder of the insert may be found in the record for the adjacent clones. Overlapping clones are noted at the beginning and end of the Features listing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Incal mapping efforts.

Repeats are identified using RepeatMasker (A. Smit and P. Green, unpublished.) for Human and Mouse sequences.

Genes and Region of sequence similarity are identified by BLAST (Nuc. Acids Res. 25:3389-3402) similarity (expect < 1e-34) to the EST and cDNA sequences. Genes demonstrate at least two exons flanked by consensus splice sites that maintained sequence continuity across the splice junctions. Sequences that are not identical matches are annotated as similar.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              QUALITY OF INDIVIDUAL BASES: This sequence meets stringent quality standards - estimated error rate less than 1 per 10,000 bases. Reports of lowest quality individual bases and measures of base quality are listed below. Description of the metrics can be found at URL: http://gc.bcm.tmc.edu:8088/quality.info/genbank.annotation.

Libert Submitted (1018-1001) Sanger Centre, Hinxton, Cambridgeshire, Cabonited (1018-1001) Sanger Centre, Hinxton, Cambridgeshire, CB10 1SA, UK. E-mail enquiries: humquery@sanger.ac.uk Clone requests: clonerquest@sanger.ac.uk

On May 17, 2001 this sequence version replaced gi:13567986.

During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all regions were either double stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality) as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest. The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases: Em:, EMBL; Sw:, SWISSPROT; Tr:, TREMBL; WP:, WORNPEP: Information on the WORNPEP.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      http://www.sanger.ac.uk/HGP/Chr10
RP11-344M19 is from the library RPCI-11.2 constructed by the group
of Pieter de Jong. For further details see

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    IMPORTANT: This sequence is not the entire insert of clone RP11-344N19 It may be shorter because we sequence overlapping sections only once, except for a 100 base overlap. The true left end of clone RP11-344N19 is at 1 in this sequence. The true left end of clone RP11-735G18 is at 84679 in this sequence. The true right end of clone RP11-735G18 is at 3263 in this sequence.
                                                                                                                             Human DNA sequence from clone RP11-344N19 on chromosome 10. Contains STSs, GSSs and a CpG island, complete sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  4733. .5068

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Louis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    NOTICE: This sequence may not represent the entire insert of this clone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This sequence was finished as follows unless otherwise noted: all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by restriction digest.
                                                                                                                                                               Bukaryota; Metazoa; Chordata; Craniata; Vertebrata; Buteleostomi; Mammalla; Butheria; Primates; Catarrhini; Hominidae; Homo.

Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

It currently consists of 19 contigs. The true order of the pleces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as * runs of N, but the exact sizes of the gaps are unknown. * This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

Submitted (12-MAY-2001) Sanger Centre, Hinxton, Cambridgeshire, Cabonitted (12-MAY-2001) Sanger Centre, Hinxton, Cambridgeshire, CBIO 1SA, UK. E-mail enquiries: humquery@sanger.ac.uk Clone requests: clone-equest@Sanger.ac.uk

On May 15, 2001 this sequence version replaced gi:13872249.

During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above. This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality) as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one MI3 subclone: and the assembly was confirmed by restriction digest. The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases: Em: EMBL; Sw: SWISSPROT; Tr:, TREMBL: Wp:, WORMPEP; Information on the WORMPEP.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          http://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence was generated from part of bacterial clone contigs of human chromosome 9, constructed by the Sanger Centre Chromosome 9 Mapping Group. Further information can be found at http://www.sanger.ac.uk/HGP/Chh9 RP11-17/FR3 is from the Library RP01-11.1 constructed by the group of Pieter de Jong. For further details see

```

the insert may be found in the record for the adjacent clones. Overlapping clones are noted at the beginning and end of the Features listing.

ANNOTATION OF FEATURES:

STSS are identified using ePCR (Genome Res. 7:541-550) searches of a local database that includes entries from dbSTS, GDB, and local mapping efforts.

Repeats are identified using RepeatMasker (A. Smit and P. Green, unpublished.) for Human and Mouse sequences.

Genes and Region of sequence similarity are identified by BLAST (GNC. Acids Res. 25:338-3402) similarity (expect < le-34) to the EST and cDNA sequences. Genes demonstrate at least two exons flanked by consensus splice sites that maintained sequence continuity across the splice junctions. Sequences that are not identical matches are annotated as similar.

SEQUENCING READ COVERAGE:Sequencing is completed to a minimum standard of double strand coverage with a minimum of 2 clones and 2 reads with no ambiguities or 2 chemistries with a minimum of 2 clones and 3 reads with no ambiguities. If the sequence quality for a region does not meet this standard, it will be indicated in the annotation as Low Coverage.

standards - estimated error rate less than 1 per 10,000 bases. Reports of lowest quality individual bases and measures of base quality are listed below. Description of the metrics can be found at URL: http://gc.bcm.tmc.edu:8088/quality.info/genbank.annotation. QUALITY OF INDIVIDUAL BASES: This sequence meets stringent quality

Sequencing vector: m13; m70815; 35% of reads
Sequencing vector: plasmid; n/a; 65% of reads
Chemistry: Dye-terminator Big Dye; 100% of reads
Assembly program: Phrap; version 0.560731
Consensus quality: 191730 bases at least 040
Consensus quality: 193959 bases at least 030
Consensus quality: 193959 bases at least 020
Insert size: 172000: agarose-fp
Insert size: 172000: agarose-fp
Quality coverage: 10.5 in 020 bases; agarose-fp
Quality coverage: 10.5 in 020
* NOTE: This is a "working draft' sequence. It currently
* consists of 8 contigs. The true order of the pieces
* is not known and their order in this sequence record is
* trins of N, but the exact sizes of the gaps are unknown.
* This record will be updated with the finished sequence
* as soon as it is available and the accession number will
* be preserved.

estimates computed by the Phrap assembly program.
All manually edited bases have been reduced to quality 10.
Quality levels above 40 are expected to have less than
1 error in 10,000 bp.
Base-by-base quality values are not generally visible from the
GenBank flat file format but are available as part
of this entry's ASN.1 file.

                                                                                                                                              * NOTE: This is a 'working draft' sequence. It currently consists of 11 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as trues of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

The present invention describes an activation-induced cytidine deaminase

(AID). AID structurally relates to an RNA editing enzyme APOBEC.1 and
has cytidine activity similar to APOBEC.1. AID has antiallergic,
antianaemic, antiasthmatic, ophthalmological, anti-HIV and
antianaemic, antiasthmatic, ophthalmological, anti-HIV and
dermatological activities, and can be used in gene therapy. AID
ceratment of B cell associated immune system disorders, immunodeficiency
diseases and allergies, such as immunoglobulin A (1gA) deficiency
disease, IgA nephritis, gamma-globulinaemia, atopic dermatitis, allergic
collitis, asthma, food allergy, drug allergy, allergic rhinitis, Rosen
disease, Didecorge disease, ataxia telangiectasia, common variable
immunodeficiency disease, AIDS (auto immunodeficiency syndrome), elevated
Id diciency disease, AIDS (auto immunodeficiency syndrome), elevated
Id diciency disease, AIDS (auto immunodeficiency syndrome), elevated
Id diciency alse selection discorder: The DNA sequences
encoding AID may be used for gene therapy and the antibodies to the AID
protein may be used for diagnosis and treatment of these disorders. The
present sequence represents a genomic DNA sequence of human AID.
                                                                                                                                                                                                              useful as
                                                                                                                                                                                                   Nucleic acid encoding activation induced cytidine deaminase, useful a target for drug development for immune-related diseases including
                                                                                                                                                                                                                                                                                               Claim 17; Page 142-145; 174pp; Japanese.

                                                                                                                                                                                                                                                                                                                          The present invention describes an activation-induced cytidine deaminase
(AID). AID structurally relates to an RNA editing enzyme APOBEC-1 and
has cytidine activity similar to APOBEC-1. AID has antiallergic,
antianaemic, antiasthmatic, ophthalmological, anti-HIV and
dermatological activities, and can be used in gene therapy. AID
polynucleotides are useful in methods for identifying drugs for the
treatment of B cell associated immune system disorders, immunodeficiency
diseases and allergies, such as immunoglobulin A (1gA) deficiency
disease, IgA nephritis, gamma-globulinaemia, atopic dermatitis, allergic
colitis, asthma, food allergy, drug allergy, allergic rhintis, Rosen
disease, DiGeorge disease, ataxia telangiectesia, common variable
immunodeficiency disease, ataxia telangiectesia, common variable
immunodeficiency disease, AIDS (auto immunodeficiency syndrome), elevated
ig disorder, and igg subclass selection disporder. The DNA sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 encoding AID may be used for gene therapy and the antibodies to the AID protein may be used for diagnosis and treatment of these disorders. The present sequence represents a genomic DNA sequence of human AID.
                                                                                                                                                                                                  cleic acid encoding activation induced cytidine deaminase, useful target for drug development for immune-related diseases including

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynuclectide sequences have applications in diagnostics, forensics, gene mapping, identification of mutetaions responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and diagnostic coding sequences of the invention.

Specification, but was obtained in electronic format directly from WIPO specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

The present invention describes an activation-induced cytidine deaminase (AID). AID structurally relates to an RNA editing enzyme APOBEC-1 and has cytidine activity similar to APOBEC-1. AID has antiallergic, antianemic, antiasthmatic, ophthalmological, anti-HIV and dermachological activities, and can be used in gene therapy. AID colynuclectides are useful in methods for identifying drugs for the reatment of B cell associated immune system disorders, immunodeficiency diseases and allergies, such as immunoglobulin A (IQA) deficiency disease, IQA nephritis, gamma-globulinaemia, atopic dermatitis, allergic colitis, asthma, food allergy, dallergy, allergic rhinitis, Rosen disease, DiGeorge disease, ataxia telangiectasia, common variable immunodeficiency disease, MHC (major histocompatibility class) class control in deficiency disease, MHC (major histocompatibility class) class control in deficiency disease, AlbS (auto immunodeficiency syndrome), elevated in deficiency disease, AlbS (auto immunodeficiency syndrome), elevated in deficiency disease, ataxia telangiectasia, common variable of the disorder, and IGS subclass selection disorder. The DNA sequences encoding AID may be used for gene therapy and the antibodiess to the AID protein may be used for diagnosis and treatment of these disorders. The present sequence represents the exon I genomic DNA sequence of human AID.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence encodes human activation-induced cytidine deaminase (AID). AID structurally relates to an RNA editing enzyme APOBEC-1 and has cytidine activity similar to APOBEC-1. AID has antialergic, antiathmatic, ophthalmological, anti-HIV and dermatclogical activities, and can be used in gene therapy. AID polynucleotides are useful in methods for identifying drugs for the

treatment of B cell associated immune system disorders, immunodeficiency diseases and allergies, such as immunoglobulin A (IgA) deficiency disease. IgA nephritis, gamma-globulinaemia, atopic dermatitis, allergic colitis, asthma, food allergy, drug allergy, allergic rhinitis, Rosen disease, DiGeorge disease, ataxia telangiectasia, common variable immunodeficiency disease, AIDS (auto immunodeficiency syndrome), elevated IT deficiency disease, AIDS (auto immunodeficiency syndrome), elevated IGE disorder, and IgG subclass selection disorder. The DNA sequences encoding AID may be used for gene therapy and the antibodies to the AID protein may be used for diagnosis and treatment of these disorders.

The present invention relates to a new human Cytochrome P450, Subfamily XXVIIA, (Steroid 27-Hydroxylase, Cerebrotendinous Kanthomatosis)

CXVVIIA, (Steroid 27-Hydroxylase, Cerebrotendinous Kanthomatosis)

CYDYAPHOLION COMPRISES a Sequence Which is a polymucleotide of the Invention comprises a sequence which is a polymuchoride of the CYDZAI contacting to reference sequence for the CYPZAI obnorphic variant for a polymorphic variant of a reference sequence for a CYPZAI cDNA or its fragment.

CC Variant of a reference sequence for a CYPZAI cDNA or its fragment.

CC VATION TO INVENTION IS also useful in studying the expression and function of CYPZAI, and in expressing CYPZAI protein for use in Screening for candidate drugs to treat diseases related to CYPZAI contacting for use in Screening for candidate drugs to studying expression of the CYPZAI isogenes in vivo, for in vivo screening and testing of drugs targeted against CYPZAI protein, and for testing the efficacy of therapeutic agents and compounds for diseases associated with CYPZAI activity, e.g. cerebrotendinous xanthomatosis, in a biological system. The invention is useful for studying the effect of the variation on the biological crust for the drugs continued to a gently of CYPZAI as well as on the binding affinity of cypzAI as well as on the binding affinity contaction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to an isolated nucleic acid molecule (I) comprising a nucleotide sequence given in Tables 1-9 (ABV00010-ABV62213) of the specification or its complement. (I) is useful for:
(a) assessing whether a patient is afflicted with prostate cancer;
(b) monitoring the progression of prostate cancer in a patient;
(c) assessing the efficacy of a test compound to inhibit prostate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         338 AATGITIGIATITITAGIAGAGAGGGGTITICACCATGITGGCCAGGCTGGTCTAAACT 279
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             (e) selecting a composition for inhibiting prostate cancer in a patient; (f) assessing the prostate cell carcinogenic potential of a compound; (g) determining whether prostate cancer has metastasized in a patient;
                                                                                                       Human; prostate cancer; cytostatic; carcinogen; pharmacodyanamic marker; pharmacogenomic marker; gene; ss.
